# Operation of an Onsite Legionella Laboratory

*Adrian Parris,*

*BOHS President 2025,26*

*Occupational Hygiene & Chemical Safety Manager,  
Sellafield Ltd*

**November 21**

**BCEC**

**Birmingham**

The logo for BOHS (British Occupational Hygiene Society) features the letters 'BOHS' in a stylized, bold, blue font. The 'O' is a circle with a dot inside, and the 'H' has a vertical bar on its right side.

British Occupational  
Hygiene Society

# Requirement For Onsite Laboratory

- *Liquid samples leaving site require radiological screening.*
- *This delays plating time to 4 days.*
- *Outside of sample stability time ISO 11731 - Water quality. Detection and enumeration of Legionella.*
- *Can lead to false negatives.*
- *Lab Commissioned in 2018.*
- *Focussed on developing rapid testing capability.*

**November 21**

**BCEC**

**Birmingham**

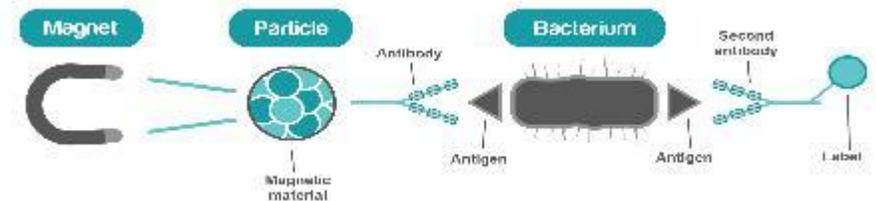

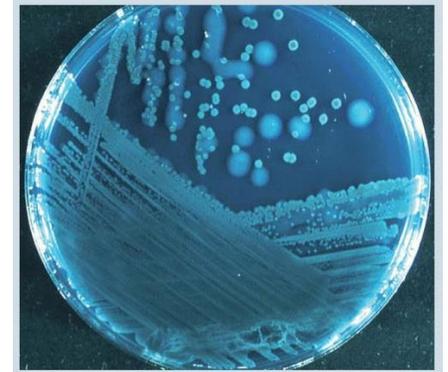

**BOHS**

British Occupational  
Hygiene Society

# Onsite Microbiological Testing Capability

- *Testing Capability.*
  - *TVCs*
  - *Pseudomonas*
  - *Sulphate Reducing Bacteria*
  - *PCR*
  - *Legipid (IMS)*
- *Working towards UKAS accreditation.*
- *Routine monitoring and testing.*
- *Supported numerous projects.*
  - *Validation of TiAOP*
  - *Deadleg flushing*
  - *Biocide Efficacy Testing*

**November 21**

Hygiene Society

**November 21**

**BCEC**

**Birmingham**

## Method Verification

- *Delay in completing.*
- *TVCs and Pseudomonas, good recovery, linearity & precision low LOD.*
- *PCR, Lower recovery rate than expected.*
  - *Firm ware update on Q16 thermocyclers.*
  - *Extraction from filter poor using orbital shaker.*
  - *Method revised to include bead beating.*
  - *Good recovery domestic and process water.*
- *Legipid*
  - *Low recovery rate.*
  - *Poor release of cells from filter.*
  - *Similar to recovery in culture method, 20 to 30%.*
  - *Method withdrawn.*

## Control Levels Existing

	Date	Legionella Bacteria	Alert Level (GU/l)	Action Level (GU/l)
Lee et al.	2011	Pneumophila	1,000	10,000
		Species	100,000	1,000,000
Colins et al.	2017	Species (non differentiated)	1,000	10,000
Young et al.	2021	Species (non differentiated)	5,000	10,000

- *Still lack of data in the public domain.*
- *Only certainty is a negative PCR is accepted as negative.*

# Proposed Control Regime – Cooling Towers

**BOHS**

British Occupational  
Hygiene Society

- How do we understand if PCR signal is showing system risk, differentiate from live or from dead legionella.
- Comparison of the level in the tower with the PCR signal from the makeup water key.
- Understanding if the system is supporting growth.

## Key Steps

- *Endorsed by Duty Holders.*
- *Adopted into written schemes.*
- *Change in mindset.*
- *Continue exploring alternative analysis methods.*

**November 21**

**BCEC**

**Birmingham**

## PhD – Research Rapid Detection Methods

- ▶ **BD flow cytometer** to detect total microbial load and intact microbial load within cooling tower samples.
- ▶ **Propidium monoazide (PMA)**, a photo reactive DNA–binding dye used to selective detect viable microorganisms in combination with qPCR.
- ▶ **Genomadix cube** a viability PCR platform used to selective detect viable *Legionella pneumophila* *sg1*.
- ▶ **Digital Droplet PCR** a more precise method by determining the actual count of DNA molecules within a sample.

**November 21**

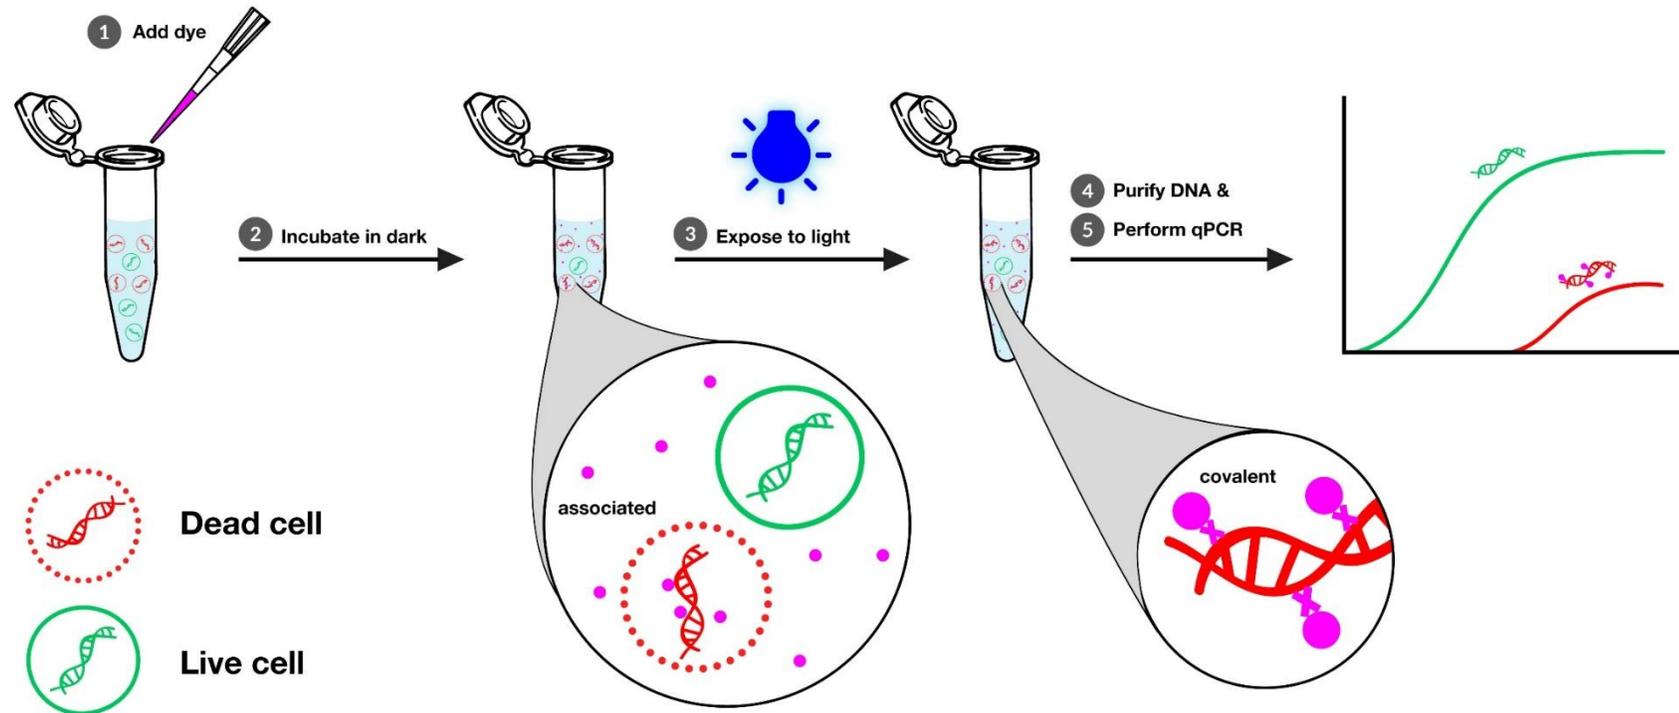

**BCEC**

**Birmingham**

## PhD – Research Rapid Detection Methods

- Propidium monoazide (PMA) is a photo reactive DNA –binding dye used to selective detect viable microorganisms by qPCR.
